roll back a bad orders-api deploy

(copied from the old wiki, owner: orders team, last checked 2025-02-10)

Use this procedure when the OrdersApiCrashLooping alert fires right after a deploy.

before you start: kubectl access to the shop namespace.

steps

1) Roll back to the previous revision.

kubectl -n shop rollout undo deploy/orders-api

should see: The rollout finishes.

2) Confirm the API is healthy.

curl -s http://orders-api:8080/health

should see: Status ok.

to undo

- Re-apply the new revision. kubectl -n shop rollout undo deploy/orders-api

if this does not help: page the orders team if the rollback does not finish.
